DEVELOPMENT OF BOARD GAMES

Board games have long been not only a useful leisure activity, but also an effective learning tool for school. Role-playing games, wandering games, quizzes or card games - they immerse children in an exciting adventure and help develop soft skills and various competencies. Creating your own game is not so difficult: expert educators have compiled step-by-step instructions for every teacher to show their superpowers in educational board games:

1. Idea. It is worth specifying exactly what theme will be revealed in the game;
2. The purpose of the game. With the help of a board game you can not only have fun, but also form specific skills and abilities that will promote creativity, motivation, independence, etc;
3. Target group for your game. Remember that the age of the players and their interest affect both the rules and the design;

4. Define the mechanics of the game: what principle drives the game? What do players do when they win or fail. Points, badges, or other game elements can also be used for additional motivation;

5. Choose the type of game or principle that will underlie its mechanics: card games, wandering, role-playing, simulation, games, quizzes.

The process of creating a game can be as interesting as the game itself, some will find this activity even more exciting. There are no limitations, you just have to try.
